Stochastic effect?
Specific Biological Effects

Dose – Response Models

Stochastic Effects
- Severity independent of dose (both somatic and genetic)
- Examples: leukemia, malignant tumors

Deterministic Effects
- Severity varies with magnitude of dose, above a threshold dose (somatic)
- Examples: cataracts, fertility impairment
**Linear No Threshold Response**

- Applies to stochastic effects
- Assumes that any amount of radiation has some detrimental effect

![Graph showing the relationship between dose and probability of occurrence](image)
Nonlinear Threshold Response

- Applies to deterministic effects
Relationships between dose and the frequency and severity of tissue reactions (deterministic effects). Upper panel: expected sigmoidal increase in frequency in a population of individuals with varying sensitivities. Lower panel: expected dose-severity relationships for three individuals with different sensitivities. from ICRP (1991b).
Table 1: Thresholds for Tissue Reactions (radiation doses that cause a 1% reaction)

Projected threshold estimates of the acute absorbed doses for 1% incidences of morbidity and mortality involving adult human organs and tissues after whole body gamma ray exposures.

Deterministic effects
from Glossary of ICRP103 (2007)

- Deterministic effect

- Injury in populations of cells, characterised by a threshold dose and an increase in the severity of the reaction as the dose is increased further. Also termed tissue reaction. In some cases, deterministic effects are modifiable by post-irradiation procedures including biological response modifiers.
Stochastic effects
from Glossary of ICRP103 (2007)

- Stochastic effects of radiation

- Malignant disease and heritable effects for which the probability of an effect occurring, but not its severity, is regarded as a function of dose without threshold.
Human Effects of Radiation

**In-Utero effects**

**Somatic effects**

**Genetic effects**

**Acute effects**
- ARS*
- Skin Erythema
- Epilation
- Sterility

**Late effects**
- Cataract
- Cancer
- Leukemia

**Deterministic effects**
- BM injury
- GIT injury
- Nerve injury

**Stochastic effects**

**Genetic disease**

* acute radiation syndrome
What happen after high dose whole body exposure?
Acute radiation syndrome (ARS)

Concept and prodromal syndrome
DEFINITION

A combination of clinical syndromes occurring in stages during a period of minutes / hours to weeks after exposure, as injury to various tissues and organs is expressed. ARS is caused by brief exposure of a major part of the body to more than approximately 1 Sv.
Acute Radiation Syndrome

A Large Gamma Radiation Dose in a Short Duration

LD$_{50/30}$ = 4.50 Gy

- Lethal dose to 50% of population in 30 days without treatment
Fig. 3 Radiation Doses and Symptoms of Acute Radiation Syndrome
**Time Course of Acute Radiation Syndrome**

- **Prodromal**
  - Anorexia
  - Nausea
  - Vomiting
  - Diarrhea
  - Asymptomatic

- **Latent**
  - Return of Prodromata
  - Infection
  - Hemorrhage

- **Manifest Illness**
- **Death**
- **Recovery**

**Time**
Dose assessment

Required for estimation of prognosis and selection of treatment options
How do we estimate exposed dose?
Dose assessment

- **Biological methods**
  - Clinical symptoms
  - Lymphocyte count
  - Chromosome analysis

- **Physical methods**
  - Reconstruction
  - ESR
  - Others

(From IAEA Safety Report Series 2, 1998)
Patterns of Early Lymphocyte Response in Relation to Dose

Curve 1-3.1 Gy; curve 2-4.4 Gy; curve 3-5.6 Gy; curve 4-7.1 Gy.

From Health Physics 72(4): 1997
Effect on organ systems

BM, GI, lung, etc.
Bone marrow injury (blood)

Leukopenia
- Immunodeficiency
- Infection

Thrombocytopenia
- Bleeding tendency
- Anemia
Change in peripheral blood count after whole body exposure (2 Sv)
GI injury
Internal cavity of intestine

Epithelial cells fall off from top of villi.

Villi

Epithelial cells reproduction by division of crypt cells and movement to top of villi

Fig. 5: Structure of inner surface of small intestine
(adopted from UNSCEAR 1988)
GI tract injury

1. Insufficiency in Regeneration of mucosal epithelial cells
   - Ileus, mal-absorption, anorexia, nausea, vomiting, diarrhea, uncontrollable GI bleeding (after progression in falling of mucosa), loss of body fluids.

2. Barrier insufficiency
   - Bacterial transmission from mucosa to blood stream
   - Sepsis
Lung injury
Lung injury by radiation (>8Gy)

Onset: 1～7 months (peak: 2–4 months)

Onset: mucosal edema (increase permiability)
→secretion accumulation in alveoli →thickening of alveoli wall

Radiation pneumonitis: 3～12weeks, loss of cells, stenosis of capillaries, hyaline membrane formation (fibrin, plasma protein)

Lung fibrosis: 6month ～、accumulation of collagen
Lung injury

Symptoms: dry cough, dyspnea, fever.
    hypoxia, respiratory failure in severe case

Diagnosis: non-specific, exclusion diagnosis. BAL
    (CMV, herpes, bacteria, fungus) ARDS.

Combined lung infection

Problem after overcoming of bone marrow
    suppression after 4 Gy and GI injury after 6 Gy,
    due to advancement of technology
Fig. 4 Radiation pneumonitis associated with the treatment of lung cancer

Radiation pneumonitis occurred six weeks after irradiation, but the tumor disappeared 2 years later and five years later, only fibrosis in the lung was left.
Neurovascular syndrome (≥20Gy)

- Prodromal syndrome: Vomiting or diarrhea etc in several minutes after exposure
- CNS symptoms: confusion, disorientation
- Edema due to vascular permeability, lung edema, pleural effusion, ascites, hypotension, shock, high fever
  - Cause: (possibly) increased permeability in brain→severe edema, vascular damage, encephalitis, etc.
- Die in 1−2 days without treatment

</tbody>
</table>
Necrosis (>25Gy, >21 days)

- Large necrotic lesion covering 1/3 of right thigh (High dose exposure by Ir-192, Yanango, Peru, 1999)

Debridment of deep necrosis and surgical intervention such as skin transplantation are required.
(modified from IAEA The radiological accident in Yanango 2000)
Late effect
Chronic skin injury (after 6 months)

- Chronic radiation dermatitis
  - Eczema like lesion
  - Ulcer formation
- Scarring, deformity, limitation of range of movement.
- Combined with fibrosis, sclerosis, bone atrophy.
- Malignant change. (mostly basal cell carcinoma. Most of them are curable.)
Cataract by radiation

- Single irradiation: over 0.5 (~2) Gy leads to opacification of lens (latency period: 6 months to 35 years)
- Equivalent dose limit for lens at present Japanese Low
  - 150mSv/y (occupational)
  - 15mSv/y (public)
  - ICRP proposed 20 mSv/y (average over 5y) as occupational dose limit recently (ICRP: Statement on tissue reactions, 2011-Apr)

(body, extremities, whole body dose = 4.5 Gy)

Modified from Radiation. Research. 155, 409-416(2001)
Atomic bomb explosion

- During the World War II
  - 1945-07-16: 1st atomic bomb explosion experiment (U.S.A.)
  - 1945-08-06: in Hiroshima
  - 1945-08-09: in Nagasaki.

- Those explosions caused
  (in addition to radiation exposures)
  - explosive winds with destruction of houses,
  - burns from heat,
  - fires

(BEIR V, 1990)
Excess Relative Risk of Solid Cancer

FIG. 3. Solid cancer dose-response function. The thick solid line is the fitted linear gender-averaged excess relative risk (ERR) dose response at age 70 after exposure at age 30 based on data in the 0- to 2-Gy dose range. The points are non-parametric estimates of the ERR in dose categories. The thick dashed line is a nonparametric smooth of the category-specific estimates and the thin dashed lines are one standard error above and below this smooth.

Preston DL, 2007
(Rad. Res. 168)
FIG. 4. Estimates of the site-specific solid cancer ERR with 90% confidence intervals and one-sided $P$ values for testing the hypothesis of no dose response. Except for sex-specific cancers (breast, ovary, uterus and prostate), the estimates are averaged over sex. All estimates and $P$ values are based on a model in which the age-at-exposure and attained-age effects were fixed at the estimates for all solid cancers as a group. The light dotted vertical line at 0 corresponds to no excess risk, while the dark solid vertical line indicates the sex-averaged risk for all solid cancers.
Increase of cancer & leukemia due to radiation

Increased mortality by radiation

- 0.5%
- 1%

It is not clear whether cancer death occurs by radiation under 100 mSv.

It is estimated 305 persons died of cancer during their whole life among 1000 persons who received 100 mSv, 5 of them are caused by radiation.

Cancer due to individual life style etc.

Cause of each cancer has not been identified but estimated due to diet, smoking, virus, or bacteria.

30% 

mortality rate due to cancer

0 mSv  100 mSv  200 mSv  300 mSv

[exposed dose]
Time course of cancer induction by radiation after atomic bomb

- Leukemia
- Cancer other than leukemia

Time after exposure

Year
Non-cancer disease incidence among Atomic bomb survivors

- Statistically significant positive linear dose-response relationship:
  - Thyroid disease ($P < 0.0001$)
  - Chronic liver disease and liver cirrhosis ($P = 0.001$)
  - Uterine myoma ($P < 0.00001$)

- New results:
  - Cataract ($P = 0.026$): significant positive dose-response
  - Glaucoma ($P = 0.025$): negative linear dose response
  - Hypertension ($P = 0.028$): significant quadratic dose-response
  - Myocardial infarction (exposed under 40 yo) ($P = 0.049$): significant quadratic dose-response
  - Kidney or ureter stone: significant only in male (sex difference verification $P = 0.007$)

- Above results did not change after adjustment for smoking or alcohol drinking

Adult Health Study Report 8.
Genetic effects

- **No evidence** of clinical or subclinical genetic effects has yet been seen in children of A-bomb survivors:

- Genetic studies: stillbirth, malformation, weight, sex ratio, chromosome aberrations, protein electrophoresis, mortality, DNA studies.
Human body has protective mechanism for repairing and recovering from radiation damage

2 types of effects: Deterministic effects and Stochastic effects. From time scale: acute effects and late effects

(Radiation effects depend on quality of radiation or dose rate)
